

ABSTRACT OF THE DISCLOSURE

An object of the present invention is to readily open a data file to the public. In a communication system of the present invention, a call setting control signal is given from a reading side communication terminal to an opening side communication terminal at first in reading a data file within a storage unit of an opening unit by using a reading unit. A communication mode discriminating section within the opening side communication terminal judges whether or not data communication is requested based on information elements within the call setting control signal. When the data communication is requested, a communication control section within a server within the reading unit connects a line for the communication between those two communication terminals and establishes a logical communication path of the data communication. When the information terminal of the reading unit requests further to read a data file other than the data files within the storage unit after starting the data communication, a data file within the storage unit is transmitted.
